Background

• The Care Support Program leverages key aspects of complex care models to support and care for the most vulnerable patients with medically and psychosocially complex issues, who tend to be high utilizers of costly health system services.

• Patients eligible for complex care services include:
  • Age 18 years or older with ≥4 chronic conditions (Diabetes or Heart Failure, asthma, COPD, depression, diabetes, heart failure, hypertension or cardiovascular disease)
  • High utilization patterns as defined by ≥2 inpatient stays or ≥3 ED/observation visits within the past 6 months
  • Patients who are represented in an ACO partnership
  • Sentinel events such as hospitalizations and ED visits offer opportunities for team/systems improvement.
  • Weekly Interdisciplinary Case Conference (ICC) offers regular opportunities for case reviews and attention to specific opportunities for quality improvement.

Project Goals

Problem: High risk populations, even after enrollment into complex care programs, disproportionately use higher levels of care.

Goal: To incorporate utilization review processes into ICC with objectives of conducting root cause analysis, capturing ACSCs, determining avoidability (at a care team/system level), and recommending interventions to the care team, the Primary Care Provider, and/or Health System.

Project Evaluation & Impact

Examples:
- Provide structured education regarding seeking appropriate levels of care
- Reinforce early sx recognition
- Improve phone tree access in primary care for non-English speaking patients
- Optimize medication review for patients discharged from SNF to home

Next Steps, Dissemination & Lessons Learned

Next Steps:
• Develop standardized data management processes to ease ability to gather and analyze pertinent data
• Explore interventions to improve early symptom recognition and self-management of chronic conditions
• Explore and test processes to improve patient access to appropriate level of care

Dissemination:
• Continue to refine ICC format as patient populations and program structure continue to change to accommodate the system’s growing needs

Lessons Learned:
• Top reasons for utilization are not ACSCs but rather pain related (abdominal, chest, etc.)
• Clinical observations: difficulty documenting utilization outside of UCSF in medical record
• Systems changes may assist to address low health literacy
